

VEEVA COMPASS PATIENT 24R1.0 DATA GOVERNANCE

Introduction

The 24R1.0 release expands the data delivery schema to include new data attributes for Compass Patient. The update includes one field length change and the introduction of 23 new fields. No fields were deprecated or removed in this release.

The changes will be captured in a new schema (v2). To support the transition to the new schema, Compass will maintain both versions until v1 is retired in April 2025:

- Current retiring schema - patient_schema_v1
- New expanding schema - patient_schema_v2

Users will be able to select the schema version to use when querying data. Existing jobs will default to the current (v1) schema. Additional documentation will be available on the Help Site to enable transitioning scheduled jobs from v1 of the schema to v2. The Product Expert team is available to support the transition of any existing jobs. Please see the data dictionary to understand the order of new fields further.

Data Schema Update Details

Change Type	Attribute	Notes
New	prescription_write_date	Add prescription_write_date - Data Type: date(YYYY-MM-DD)
New	product_name_vid	Add product_name_vid - Data Type: varchar(18)
